CLASHCALLERBOT-REDDIT

1.1 clashcallerbot_database module

Setup the MySQL-compatible database.

If run directly, this module will setup the clashcallerbot database with tables and display their format and contents. Additionally, this module provides a class with various methods for managing the MySQL-compatible database:

- Create database and tables.
- View table data and properties.
- Grant user permissions (if logged into database as root).
- · Add rows to tables.
- · Delete tables and rows.
- Convert python datetime to MySQL datetime.

Bases: object

Implements a class for a ClashCaller Database.

config file

A configparser object with database.ini file pre-read.

Type configparser.ConfigParser()

root_user

Specifies whether the database will be setup as root user.

Type bool

mysql_connection

A mysql.connector.connect() object.

Type mysql.connect()

cursor

A mysql.connector.connect().cursor() object.

Type mysql.connect()cursor()

$\textbf{close_connections}\,(\,)\,\to None$

Close database connections.

Method closes database cursor and connection.

Returns None

Converts python datetime to MySQL datetime.

Method converts given python datetime object to MySQL datetime format.

Parameters dt – Datetime object in default format.

Returns Datetime object in MySQL format.

create database() \rightarrow bool

Create database

Method creates database with database name.

Returns True if successful, False otherwise.

```
create\_table(tbl\_name: str, cols: str) \rightarrow bool
```

Create table in database.

Method creates table in database with given name and specifications.

Parameters

- **tbl_name** Name to give table.
- cols Columns to put in table.

Example

:: tbl_name = 'table' cols = 'id INT UNSIGNED NOT NULL AUTO_INCREMENT, ' 'permalink VAR-CHAR(100), message VARCHAR(100), new_date DATETIME, ' 'userID VARCHAR(20), PRI-MARY KEY(id)'

```
create_table(tbl_name, cols)
```

Returns True if successful, False otherwise.

```
delete message (tid: str) \rightarrow bool
```

Deletes message from message_data table.

Method deletes given table id (row) from message_data table.

Parameters tid – Table id from id column of message_data table.

Returns True for success, False otherwise.

```
describe_table (tbl_name: str) \rightarrow list
```

Gets description of table.

Method returns a list describing the structure of the given table.

Parameters tbl name - Name of table to describe

Returns List with table description, empty list otherwise.

Return type description

```
drop\_table(tbl\_name: str) \rightarrow bool
```

Drop table from database.

Function drops given table from given database.

Parameters tbl_name - Table to drop.

Returns True if successful, False otherwise.

 $find_comment_id(cid: str) \rightarrow bool$

Check comment_list table for comment id.

Method checks comment_list table for given comment id.

Parameters cid – Comment id to search for.

Returns True for success, false otherwise.

 $\texttt{get_messages}$ (time_now: datetime.datetime) \rightarrow list

Retrieves list of messages that have expired.

Method returns list of messages whose expiration times are before current datetime.

Parameters time_now - Current datetime.

Returns List containing results of query.

Return type messages

get_rows ($tbl_name: str$) \rightarrow tuple

Fetch table rows.

Method gets rows of given table by order of id in a tuple.

Parameters tbl_name – Name of table to get rows from.

Returns Tuple containing each row's data, empty tuple otherwise.

Return type rows

 $get_tables() \rightarrow list$

Return table list of database.

Method returns a list with the names of the tables.

Returns List of table names.

Return type table_names

 $grant_permissions() \rightarrow bool$

Grants bot user permissions to database.

Method grants bot user permissions to database.

Returns True if successful, False otherwise.

Notes

Only database root user can grant database permissions.

lock read ($tbl \ name: str) \rightarrow bool$

Locks table for reading.

Method locks a given table for read access.

Parameters tbl_name - Name of table to lock.

Returns True if successful, False otherwise.

Notes

- Any previous locks are implicitly released.
- Read locks have lower priority than write locks.

```
lock write (tbl \ name: str) \rightarrow bool
```

Locks table for writing.

Method locks a given table for write access.

Parameters tbl_name - Name of table to lock.

Returns True if successful, False otherwise.

Notes

- Any previous locks are implicitly released.
- Write locks have higher priority than read locks.

```
save\_comment\_id(cid: str) \rightarrow bool
```

Saves comment id into comment_list table.

Method saves given comment id into the comment_list table.

Parameters cid - Comment id to save.

Returns True for success, false otherwise.

 $save_message$ (link: str, msg: str, exp: <module 'datetime' from '/usr/lib/python3.6/datetime.py'>, usr_name: str) \rightarrow bool

Saves given comment data into message_data table.

Method saves given inputs in message_date table as a row.

Parameters

- link Comment permalink.
- msg Comment message.
- **exp** Expiration datetime object.
- usr name Comment author username.

Returns True for success, false otherwise.

```
select database() \rightarrow bool
```

Select database for command execution.

Method selects database within MySQL for command execution.

Returns True if successful, False otherwise.

clashcallerbot_database.main()

1.2 clashcallerbot reply module

Checks messages in database and sends PM if expiration time passed.

This module checks messages saved in a MySQL-compatible database and sends a reminder via PM if the expiration time has passed. If so, the message is removed from the database.

```
clashcallerbot_reply.get_parent ( \mathit{link: str}) \, \to \mathit{str}
```

Fetch parent comment or submission.

Function gets parent comment of given permalink or submission if top level comment.

Parameters link – Permalink to get parent of.

Returns Parent comment link or default string.

Return type parent

```
clashcallerbot_reply.main()
```

```
clashcallerbot_reply.send_reminder(link: str, msg: str, usr: str) \rightarrow bool
```

Sends reminder PM to username.

Function sends given permalink and message to given username.

Parameters

- link Permalink to comment.
- msg Message in comment that was saved.
- **usr** User to send reminder to.

Returns True if successful, False otherwise.

1.3 clashcallerbot_search module

Searches recent reddit comments for ClashCaller! string and saves to database.

This module uses the Python Reddit API Wrapper (PRAW) to search recent reddit comments for the ClashCaller! string.

If found, the userID, permalink, comment time, message, and expiration time (if any) are parsed. The default, or provided, expiration time is applied, then all the comment data is saved to a MySQL-compatible database.

The comment is replied to, then the userID is PM'ed confirmation.

```
clashcallerbot_search.have_replied(cid: str, bot\_name: str) \rightarrow bool Checks if bot user has replied to a comment.
```

Function checks reply authors for bot user.

Parameters

- cid Comment ID to get replies of.
- bot_name Name of bot to check for.

Returns True if successful, False otherwise.

```
clashcallerbot_search.is_recent (cmnt: praw.models.reddit.comment.Comment) \rightarrow bool Checks if comment is a recent comment.
```

Function compares comment time with program start time.

Parameters cmnt – praw comment object.

Returns True if comment time is after start time, False otherwise.

```
clashcallerbot_search.main()
```

clashcallerbot_search.send_confirmation (u_name: str, link: str, exp: datetime.datetime) \rightarrow

Send confirmation to reddit user.

Function sends given user confirmation of given expiration time with given link.

Parameters

- u_name username of user.
- link Permalink of comment.
- **exp** Expiration datetime of call.

Returns True if successful, False otherwise.

```
clashcallerbot_search.send_confirmation_reply (cid: str, link: str, exp: datetime.datetime) \rightarrow str
```

Replies to a comment.

Function replies to a given comment ID with a given message.

Parameters

- cid Comment ID to reply to.
- link Permalink of comment.
- **exp** Expiration datetime of call.

Returns id of new comment if successful, None otherwise

Return type comment_id

clashcallerbot_search.send_error_message (u_name: str, link: str, error: str) \rightarrow bool Send error message to reddit user.

Function sends given error to given user.

Parameters

- u name username of user.
- link Permalink of comment.
- **error** Error to send to user.

Returns True if successful, False otherwise.

1.4 logging_conf module

Defines logging dictionary.

Module defines dictionary for logging.config.dictConfig()

CHAPTER

TWO

INDICES AND TABLES

- genindex
- modindex
- search
